Anwendungsbeschreibung	Iberdomide is a modulator of the cullin ring ligase 4-cereblon E3 ubiquitin ligase complex with higher affinity ($IC_{50} = 60 \text{ nM}$) than lenalidomide and pomalidomide leading to more potent degradation of Ikaros (IKZF1, $EC_{50} = 1 \text{ nM}$) and Aiolos (IKZF3, $EC_{50} = 0.5 \text{ nM}$).¹ It is more specific for the cereblon complex and does not degrade GSPT1 or CK1α. It displays antitumor and immunostimulatory activity in lenalidomide- and pomalidomide-resistant multiple myeloma cells.² Iberdomide has also shown efficacy in treating the autoimmune disease cutaneous lupus erythematosus (CLE).³ It was also shown to act as an HIV-1 latency reversal agent in CD4⁺ T-cells.⁴
