Anwendungsbeschreibung

Human Amyloid beta 42 (AB42) ELISA Kit employs a two-site sandwich ELISA to quantitate AB42 in samples. An antibody specific for AB42 has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any AB42 present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugate Human AB42 detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of AB42 bound in the initial step. The color development is stopped and the intensity of the color is measured.
