Anwendungsbeschreibung

Human Acetylcholine (ACH) ELISA Kit employs a two-site sandwich ELISA to quantitate ACH in samples. An antibody specific for ACH has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any ACH present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugate Human ACH detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of ACH bound in the initial step. The color development is stopped and the intensity of the color is measured.
