Proben	Cell culture supernatantsSerumPlasmaOther biological fluids

Anwendungsbeschreibung

This Human Adenosine deaminase, ADA ELISA Kit employs a two-site sandwich ELISA to quantitate ADA in samples. An antibody specific for ADA has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any ADA present is bound by the immobilized antibody. After removing any unbound substances, a biotin-conjugated antibody specific for ADA is added to the wells. After washing, Streptavidin conjugated Horseradish Peroxidase (HRP) is added to the wells. Following a wash to remove any unbound avidin-enzyme reagent, a substrate solution is added to the wells and color develops in proportion to the amount of ADA bound in the initial step. The color development is stopped and the intensity of the color is measured.
