Anwendungsbeschreibung

Human Adiponectin (ADP) ELISA Kit employs a two-site sandwich ELISA to quantitate Adiponectin in samples. An antibody specific for Adiponectin has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any Adiponectin present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugate Human Adiponectin detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of Adiponectin bound in the initial step. The color development is stopped and the intensity of the color is measured.
