Anwendungsbeschreibung

This Human Retinoic acid receptor alpha (RARA) ELISA Kit employs a two-site sandwich ELISA to quantitate RARA in samples. An antibody specific for RARA has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any RARA present is bound by the immobilized antibody. After removing any unbound substances, a biotin-conjugated antibody specific for RARA is added to the wells. After washing, Streptavidin conjugated Horseradish Peroxidase (HRP) is added to the wells. Following a wash to remove any unbound avidin-enzyme reagent, a substrate solution is added to the wells and color develops in proportion to the amount of RARA bound in the initial step. The color development is stopped and the intensity of the color is measured.
