Anwendungsbeschreibung

Human Catecholamine (CA) ELISA Kit employs a two-site sandwich ELISA to quantitate Catecholamine in samples. An antibody specific for Catecholamine has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any Catecholamine present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugate Human Catecholamine detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of Catecholamine bound in the initial step. The color development is stopped and the intensity of the color is measured.
