Anwendungsbeschreibung

Human Glutathione (GSH) ELISA Kit employs a two-site sandwich ELISA to quantitate Glutathione in samples. An antibody specific for Glutathione has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any Glutathione present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugate Human Glutathione detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of Glutathione bound in the initial step. The color development is stopped and the intensity of the color is measured.
