Anwendungsbeschreibung

Human Interferon beta (IFN-beta) ELISA Kit employs a two-site sandwich ELISA to quantitate IFN-beta in samples. An antibody specific for IFN-beta has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any IFN-beta present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugate Human IFN-beta detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of IFN-beta bound in the initial step. The color development is stopped and the intensity of the color is measured.
