Anwendungsbeschreibung

Human C-type natriuretic peptide (CNP) ELISA Kit employs a two-site sandwich ELISA to quantitate CNP in samples. An antibody specific for CNP has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any CNP present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugate Human CNP detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of CNP bound in the initial step. The color development is stopped and the intensity of the color is measured.
