Anwendungsbeschreibung

Human Aryl hydrocarbon receptor (AHR) ELISA Kit employs a two-site sandwich ELISA to quantitate AHR in samples. An antibody specific for AHR has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any AHR present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugate Human AHR detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of AHR bound in the initial step. The color development is stopped and the intensity of the color is measured.
