Anwendungsbeschreibung

Mouse Sendai Virus (SeV) ELISA Kit employs a two-site sandwich ELISA to quantitate SeV in samples. An antibody specific for SeV has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any SeV present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugate Mouse SeV detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of SeV bound in the initial step. The color development is stopped and the intensity of the color is measured.
