Anwendungsbeschreibung	<p>Indoximod is a modulator of indoleamine 2,3-dioxygenase (IDO) activity.<sup>1</sup> IDO can be used by tumors to avoid elimination by the host immune response<sup>2,3</sup>, thus inhibition of IDO is an interesting cancer therapeutic option. Indoximod is not a direct inhibitor of IDO, but instead targets the IDO gene leading to downstream effects.<sup>3</sup> IDO-mediated catabolism of tryptophan inhibits the immunoregulatory kinases mTOR and PKC<sup>5</sup>. This is relieved by Indoximod acting as a potent tryptophan mimetic restoring mTOR and PKC signaling.<sup>4</sup></p>
