Anwendungsbeschreibung	<p>A synthetic adenosine analog that inhibits DNA biosynthesis and is a clinically useful antineoplastic agent.¹ In cells fludarabine accumulates as its 5-triphosphate (F-ara-ATP) for which the rate-limiting step in formation is the conversion of fludarabine to its monophosphate.² F-ara-ATP has multiple mechanisms of action including inhibition of ribonucleotide reductase, DNA polymerase, ligase and primase.² A frequently used agent in myeloablative conditioning regimens for allogeneic hematopoietic cell transplantation.³ Immunosuppressive effects are mediated via inhibition of TNF-stimulated production of IL-2 and IFN- through inactivation of NFκB.⁴ Antagonist at adenosine A1 receptors.⁵</p>
