Product Description	The protein encoded by this gene is a homeobox-containing developmental regulator associated with liver development. The encoded protein binds to the alpha-fetoprotein (AFP) gene promoter and increases the expression of AFP. This gene is overexpressed in the liver and is also expressed in the heart, lung, and kidney. The protein is a member of the NKX homeobox gene family, which includes NKX2.1, NKX2.2, and NKX2.5. These genes are involved in the development and function of various tissues, particularly in the nervous system and endocrine system.
