It is synthesized as a 32 kDa proprotein which is cleaved by furin in the Golgi to release the active ligand. APRIL binds to two receptors, TACI and BCMA, which are members of the TNF receptor superfamily. TACI is expressed on B cells and BCMA is expressed on plasma cells. APRIL is involved in the regulation of B cell differentiation and proliferation, and it has been implicated in the development of various diseases, including rheumatoid arthritis, multiple sclerosis, and cancer.
