Application Notes	<p>Inhibitor of ATP citrate lyase (ACL) and activator of AMPK used in the treatment of hypercholesterolemia.^{1,2} In vivo, the active molecule is the CoA ester.² Bempedoic acid requires activation by very long-chain acyl-CoA-synthetase (ACSVL1) - the absence of ACSVL1 in skeletal muscle provides a mechanistic basis for its use in statin-intolerant patients.³ LDL receptor upregulation, decreased LDL-C, and attenuation of atherosclerosis activities are independent of AMPK activation. It significantly cuts the risk of major cardiovascular events.⁴ Combination treatment of breast and pancreatic cancer cell lines with bempedoic acid and CDK4/6 inhibitors reduced cell growth and invasion.⁵ It displays anti-inflammatory activity possibly through both ACL inhibition^{6,7} and AMPK activation⁸.</p>
