Application Notes

Human 17-Hydroxyprogesterone (17-OHP) ELISA Kit employs a two-site sandwich ELISA to quantitate 17-OHP in samples. An antibody specific for 17-OHP has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any 17-OHP present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugate Human 17-OHP detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of 17-OHP bound in the initial step. The color development is stopped and the intensity of the color is measured.
