Application Notes

Human Renalase (RNLS) ELISA Kit employs a two-site sandwich ELISA to quantitate Renalase in samples. An antibody specific for Renalase has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any Renalase present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugate Human Renalase detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of Renalase bound in the initial step. The color development is stopped and the intensity of the color is measured.
