Application Notes

Human leukocyte antigen G (HLA-G) ELISA Kit employs a two-site sandwich ELISA to quantitate HLA-G in samples. An antibody specific for HLA-G has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any HLA-G present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugate Human HLA-G detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of HLA-G bound in the initial step. The color development is stopped and the intensity of the color is measured.
