Application Notes	<p>Analog of the natural amides occurring in Echinacea which represent a new class of cannabinomimetic compounds. This class of compounds modulates TNFalpha mRNA expression in human monocytes/macrophages via the CB2 receptor.¹ Dienamide A2 binds to cannabinoid receptors with greater affinity than endogenous cannabinoids (Ki= ~60 and >1500 nM for CB2 and CB1 respectively)². It elevates intracellular Ca²⁺ levels in CB2-positive but not in CB2-negative cells and this effect was blocked by SR144528.² It significantly inhibits LPS-induced TNFalpha and IL-1beta expression in a CB2-independent manner.²</p>
