Application Notes

Pridopidine is being studied as a potential treatment for Huntingtons disease, Parkinsons disease, and schizophrenia based on its locomotor stabilizing and antipsychotic-like effects.^{1,2} It was, unusually, able to reverse both hypo- and hyperdopaminergia depending on local dopamine concentrations without inducing catalepsy. This was originally attributed to functional dopamine D2 antagonism with fast on/off kinetics ("dopamine stabilizer").³ More recent studies have attributed pridopidines effects to its being a more potent sigma-1 ligand than a D2 ligand.^{4,5} Displays neuroprotective/restorative effects^{6,7} and ameliorates central features of amyotrophic lateral sclerosis pathology⁸ in a sigma-1-mediated manner
