Application Notes

R162 (64302-87-0) is a selective inhibitor of glutamate dehydrogenase 1 (GDH1), a commonly upregulated enzyme in human cancers ( $K_i = 28.6 \mu\text{M}$ ). It does not inhibit the activity of other NADPH enzymes such as 6-phosphogluconate dehydrogenase and fumarate hydratase. R162 treatment lead to decreased fumarate levels, lower glutathione peroxidase activity, increased ROS levels and reduced cell proliferation in H1299 and MDA-MB231 cells. R162 sensitizes LKB-1 deficient tumor cells to anoikis induction. R162 treatment (at 20 mg/kg/day) significantly attenuates metastatic potential in a xenograft mouse model.<sup>2</sup> GDH1 is a promising antimetastasis target and R162 us a useful tool for proof of principal studies.
