Application Notes

NAMPT is the rate-limiting enzyme in the nicotinamide adenine dinucleotide (NAD⁺) salvage pathway that converts nicotinamide to nicotinamide mononucleotide (NMN) which is responsible for most of the NAD⁺ formation in mammals.¹ Cellular levels of NAD⁺ have been shown to decrease with age and NAMPT is believed to be a key enzyme in the aging/senescence process.² SBI-797812 is a NAMPT activator, turning it into a "super catalyst that more efficiently generates NMN.³ It increases NMN levels and prevents NAD⁺ feedback inhibition in a cell-free assay using recombinant human NAMPT at a concentration of 2 μM. In mice (20 mg/kg), it increases liver levels of NAD⁺ and shows a trend toward increased levels in cardiac tissue but does not affect levels in the quadriceps, or gastrocnemius.³
